

QuickDraw Explorer

View, edit and export Google QuickDraw drawings in a few clicks.

Pick a QuickDraw **.ndjson** file on your computer, flip through the drawings, tidy up their points and save clean **SVG** files.

No server, no account, no upload — everything stays on your machine.

1 Open a file

Click **Open an .ndjson file** and choose a QuickDraw file from your computer. The number of drawings is shown right away.

2 Browse

Use the **arrow buttons** beside the drawing, or the **← →** keys, to move from one drawing to the next. **Random** jumps to any drawing.

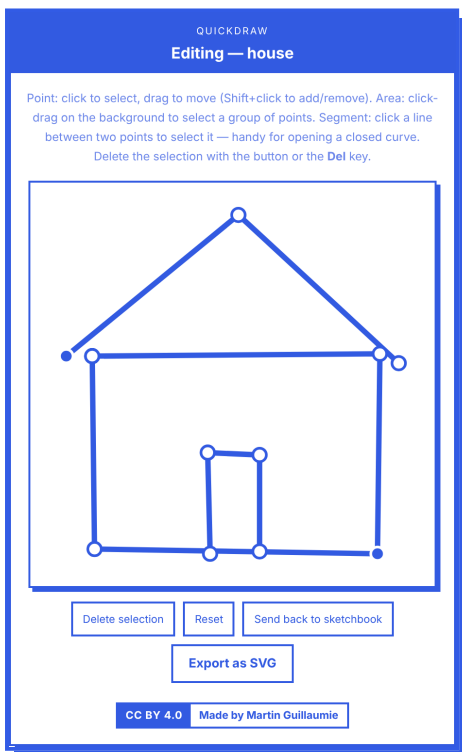

3 Export one drawing

Export SVG saves the drawing on screen as a clean, scalable vector file.

Need data?

Download category files (cat.ndjson, house.ndjson...) from Google's **Quick, Draw!** dataset:

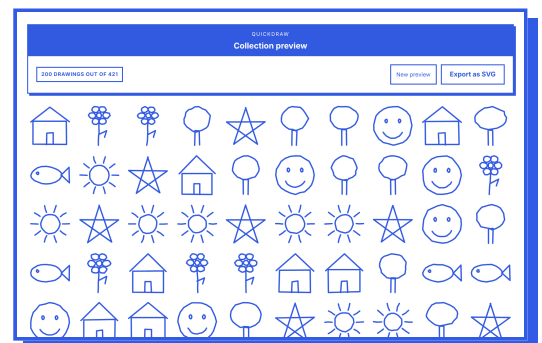

github.com/googlecreativelab/quickdraw-dataset. The **FR | EN** switch in the corner changes the interface language.

4 Edit the points

Press **Edit** to open the editor window.

- **Drag** a point to move it.
- **Click** a point — or drag a box on the background — to select points (Shift+click adds or removes one).
- **Click a line** between two points to select it. Deleting it **opens a closed curve**.
- Press **Del** to delete the selection.
- **Export as SVG** saves your edit, or **Send back** updates the sketchbook.

5 Preview the collection

Collection preview shows 200 random drawings in a 10 × 20 grid. **New preview** draws another set without closing the window, and the whole grid exports as one SVG.
